

Web Application Development - React Lists

Duration: 15 minutes.

* Indicates required question

1. Full Name *

2. Student ID *

3. When using the map function to transform an array item into a `<li>` element, what of the following code snippets should be inside the `<li>` tag to render the list item correctly in the following format: Ice Cream - 200 cal

* 2 points

Mark only one oval.

☐ `<li>${dessert.name} - ${dessert.calories} cal</li>`

☐ `<li>dessert.name - dessert.calories + "cal"</li>`

☐ `<li>{dessert.name} - {dessert.calories} cal</li>`

4. Which of the following statements about keys in React are true? *

2 points

Check all that apply.

- ☐ Keys always positively impact app performance and user interface (UI).
- ☐ Keys instruct React about whether a specific element's internal state should be preserved or not.
- ☐ Keys help React determine which items have changed, are added or are removed.
- ☐ Keys instruct React how to treat a specific element when an update occurs.

5. What could be a potential problem of using a randomiser function that generates an integer number from 0 * 2 points to 10 as a key for your list items, having a list of only eight items?

Check all that apply.

- ☐ The randomiser function does not entirely guarantee that the keys it generates will be different per item and a collision could happen, having two items with the same integer as keys.
- ☐ There is no persistence of the keys generated since the moment the component re-renders the keys will vary and that could cause unexpected UI changes.
- ☐ The randomiser function is a potential performance bottleneck since it has to run every re-render and it's an unnecessary computation.

6. What are the potential problems of using indexes as keys? *

2 points

Mark only one oval.

- ☐ If the order of items may change, that can negatively impact performance and may cause issues with component state.
- ☐ An index is not guaranteed to be unique.
- ☐ The index is not persisted and will change the moment the component re-renders.

7. It is recommended to use item indexes as keys when selecting keys for rendered list items. *

2 points

Mark only one oval.

- ☐ True
- ☐ False
