

Web Application Development - React Forms

Duration: 15 minutes.

* Indicates required question

1. Full Name *

2. Student ID *

3. You are using controlled components in React in order to have more control over the forms in an application * 1 point
you are creating. Which of the following **props** is used to perform state delegation?

Mark only one oval.

☐ onChange

☐ onSubmit

☐ value

4. Imagine you'd like to better control the submission of a form you are creating for an app. Which **prop** is required to prevent the default behavior of the form submit event in React? * 1 point

Mark only one oval.

- ☐ onSubmit
- ☐ onChange
- ☐ preventDefault
- ☐ value

5. How do you prevent the default behavior of the form HTML tag in React when a submission event occurs? * 1 point

Mark only one oval.

- ☐ By returning false from the onSubmit function prop that the form tag provides.
- ☐ By calling preventDefault on the event object inside any onChange handler from an input tag.
- ☐ By calling preventDefault on the event object inside the onSubmit function prop from the form tag.

6. What are the two props you need to add when creating a **controlled range component**? *

1 point

Mark only one oval.

- ☐ htmlFor and id
- ☐ min and max
- ☐ range and max
- ☐ value and onChange

7. When you need to change the password state, which is stored as an object with two properties, **value** and **isTouched**, how should you correctly use the **setPassword** state setter inside the **onChange** event handler?

* 1 point

Mark only one oval.

- ☐ setPassword({ ...password, value: e.target.value });
- ☐ setPassword({ isTouched: false, value: e.target.value });
- ☐ setPassword({ value: e.target.value });

8. What's the correct **event prop** you should use to determine when an input **has been interacted** with at least once? * 1 point

Mark only one oval.

- ☐ onFocus
- ☐ onBlur
- ☐ onChange

9. What of the following input types does **not** have a controlled version when they are used in React? * 1 point

Mark only one oval.

- ☐ <input type="text" />
- ☐ <input type="file" />
- ☐ <textarea />

10. What are some of the features of controlled components? * 1 point

Check all that apply.

- ☐ Enforcing a specific input format.
- ☐ Conditionally disabling the submit button.
- ☐ Validating all values in the client side when a submission occurs in the form, before calling the server endpoint.

11. How do you get the value of an input when its state is handled by the DOM (Uncontrolled)? *

1 point

Mark only one oval.

- ☐ Using local state and initializing it to an empty string. Then, reading the input value from the event object when the submission happens and finally setting the local state with that value.
- ☐ Using a combination of useEffect and useRef hooks, where a ref is used on the uncontrolled input and then its value can be read on useEffect after a re-render cycle happens.
- ☐ Using a ref via useRef hook, assigning it to the input and then reading the input value when the submission happens via ref.current.value.

12. What is the data type of the returned value from the useRef hook invocation? *

1 point

Mark only one oval.

- ☐ An object.
- ☐ An array.
- ☐ A string.
- ☐ It can be any data type.

13. A common scenario for using the useRef hook is to ____ . *

1 point

Mark only one oval.

- ☐ focus the cursor into an input field.
- ☐ control a component's state.
- ☐ handle side effects.
- ☐ memorize expensive operations.

14. What happens when you click on the submit button in the below code snippet? *

1 point

```
<form onSubmit={() => alert("Submitting")}>  
  <input type="text" value={text} onChange={e => setText(e.target.value)} />  
  <input type="button" value="Submit" />  
</form>
```

Mark only one oval.

- ☐ The onSubmit callback is executed and an alert is shown with the text "Submitting".
- ☐ An error is thrown.
- ☐ Nothing happens when the button is clicked.

15. What is missing in the below code for the select component to work properly? *

1 point

```
<select onChange={handleChange}>  
  <option value="grapefruit">Grapefruit</option>  
  <option value="lime">Lime</option>  
  <option value="coconut">Coconut</option>  
  <option value="mango">Mango</option>  
</select>
```

Mark only one oval.

- ☐ Each option tag should be accompanied by a label tag.
- ☐ Each option tag should have an onChange handler.
- ☐ The select tag is missing a value prop.
